The hyphen.cfg file for LuaT_EX

Khaled Hosny, Élie Roux, and Manuel Pégourié-Gonnard khaledhosny@eglug.org elie.roux@telecom-bretagne.eu mpg@elzevir.fr

2012/04/16 v1.5

Abstract

This is a modified version of the file hyphen.cfg distributed with the babel package, with a supporting Lua module, aimed at adapting babel's hyphenation patterns loading mechanism to LuaTEX's dynamic pattern loading capabilities. It makes use of a language.dat.lua file (whose format is described below) that should be present in the distribution, in addition to the regular language.dat file.

There is a version of etex.src modified for the same reasons using similar code, which also makes use of the luatex-hyphen.lua and language.dat.lua files described here.

1 Documentation

Hyphenation patterns should be loaded at runtime with LuaTEX: if they appear in the format, they will be rehashed when the format is loaded anyway, which makes the format quite long to load (many seconds even on modern machines) and provides for bad user experience. Hence, it is desirable to load as few patterns as possible in the format, and load on-demand the needed patterns at runtime.

This package provides a modified version of hyphen.cfg adapted to LuaTEX, as well as a supporting Lua module. Since a lot of things, especially the catcodes, are not as predictable at runtime than at format creation time, we don't \input the usual pattern files, but rather load the patterns using the Lua interface, using a special plain text version of the pattern files if available.

The existence and file name of such a version cannot be guessed, so we need a specific database: the file language.dat.lua. This file should be loadable by Lua and return a table whose keys are the canonical language names as found in language.dat, and the values are Lua tables consisting of:

1. A fixed part with one mandatory field:

```
synonyms = { <string> alternative name, ...}
```

This field's value must be the same as in language.dat.

- 2. A variable part consisting of either:
 - For most languages:

```
patterns = <string> filenames for patterns
hyphenation = <string> filenames for exceptions
```

Each string contains a coma-separated list of file names (whitespace before or after the coma is not accepted). The files given by patterns (resp. hypenation) must be plain text files encoded in UTF-8, with only patterns (resp. exceptions) and not even comments: their content will be used directly without being parsed by TEX. If one of these keys is missing or is the empty string, it is ignored and no patterns (resp. exceptions) are loaded for this language.

- Special cases are supported by a field special. Currently, the following kind of values are recognized:
 - 'disabled: <reason>' allows to disable specific languages: when the user tries to load this language, an error will be issued, with the <reason>.
 - 'language0' only english should use this type of special, to indicate it is normally dumped in the format as \language0 (see below).

Special languages may have *hyphenmin information when it makes sense (mostly \language0).

3. Optional fields may be added. For example:

```
loader = <string> name of the TeX loader
lefthyphenmin = <number> value for \lefthyphenmin
righthyphenmin = <number> value for \righthyphenmin
```

Those fields are present in language.dat.lua as generated by tlmgr, for example, but they are not used by the present code in any way.

Languages that are mentioned in language.dat but not in language.dat.lua will be loaded in the format. So, if the language.dat.lua file is missing or incomplete, languages will just go back to the "old" behaviour, resulting in longer startup time, which seems less bad than complete breakage.

For backward compatibility, Knuth's original patterns for US English are always loaded in the format, as \language0.

The modified version of hyphen.cfg provided here checks for the engine, and should continue to work with any engine without any modified behaviour. However, it is recommended to install it in such a way that the original hyphen.cfg from babel is found first by any engine other than LuaTeX.

¹It is assumed to be the first entry in language.dat.

2 Implementation

2.1 luatex-hyphen.lua

35

return

```
1 (*lua)
   Start a Lua module, importing only the necessary functions as locals.
2 local error, dofile, pairs, ipairs = error, dofile, pairs, ipairs
3 local io, texio, lang, kpse = io, texio, lang, kpse
4 module('luatexhyphen')
   Two functions for error and information reporting.
5 local function wlog(msg, ...)
      texio.write_nl('log', 'luatex-hyphen: '..msg:format(...))
7 \text{ end}
8 local function err(msg, ...)
       error('luatex-hyphen: '..msg:format(...), 2)
   Load the language.dat.lua file with the Lua version of the language database.
11 local dbname = "language.dat.lua"
12 local language_dat
13 local dbfile = kpse.find_file(dbname)
14 if not dbfile then
15
      err("file not found: "..dbname)
16 \; \mathtt{else}
      wlog('using data file: %s', dbfile)
17
      language_dat = dofile(dbfile)
18
19 end
   Look up a language in the database, and return the associated information, as
well as the canonical name of the language.
20 function lookupname(name)
      if language_dat[name] then
22
          return language_dat[name], name
23
      else
          for canon, data in pairs(language_dat) do
24
               for _,syn in ipairs(data.synonyms) do
25
                   if syn == name then
26
27
                       return data, canon
                   end
28
29
               end
30
          end
31
      end
32 end
   Set hyphenation patterns and exceptions for a language given by its name (in
the database) and number (value of \language). Doesn't return anything, but
will call error() if things go wrong.
33 function loadlanguage(lname, id)
      if id == 0 then
34
```

```
36
      end
      local msg = "loading%s patterns and exceptions for: %s (\\language%d)"
37
   Lookup the language in the database.
      local ldata, cname = lookupname(lname)
38
      if not ldata then
39
           err("no entry in %s for this language: %s", dbname, lname)
40
      end
41
   Handle special languages.
42
      if ldata.special then
43
           if ldata.special:find('^disabled:') then
               err("language disabled by %s: %s (%s)", dbname, cname,
44
                   ldata.special:gsub('^disabled:', ''))
45
           elseif ldata.special == 'language0' then
46
               err("\\languageO should be dumped in the format")
47
48
           else
               err("bad entry in %s for language %s")
49
50
           end
51
      end
   The generic case: load hyphenation patterns and exceptions from files given
by the language code.
      wlog(msg, '', cname, id)
52
      for _, item in ipairs{'patterns', 'hyphenation'} do
53
          local filelist = ldata[item]
54
          if filelist \sim= nil and filelist \sim= '' then
55
             for _, file in ipairs(filelist:explode(',')) do
56
               local file = kpse.find_file(file) or err("file not found: %s", file)
57
               local fh = io.open(file, 'r')
58
               local data = fh:read('*a') or err("file not readable: %s", f)
59
               fh:close()
60
               lang[item](lang.new(id), data)
61
62
             end
63
           else
               if item == 'hyphenation' then item = item..' exceptions' end
64
               wlog("info: no %s for this language", item)
65
66
           end
      end
67
68 end
69 function adddialect(dialect, language)
      if dialect ~= '0' then
70
          dialect = dialect:gsub('10', '')
71
          language = language:gsub('10', '')
72
73
          data = language_dat[language]
74
          if data then
               data.synonyms[#data.synonyms+1] = dialect
75
76
           end
77
      end
78 \; \mathrm{end}
79 (/lua)
```

With LuaT_EX, load patterns and exceptions on the fly using functions from the supporting Lua module, unless of course they are already loaded for this language (identified by its number to avoid problems with synonyms).

Also, since this code will be executed at runtime, be careful while testing if we're using LuaT_FX.

In the LuaTEX case, we have to decide wether to load the language now. Remember our choice, since we'll need it two times more.

If we choose to load the language now, mark it as loaded. This is done using TEX macros in order to survive the format dumping-loading cycle, which would not be as straigthforward using Lua objects.
